

# LOW VOLTAGE CABLING

The best cabling  
design plan for all your  
digital systems

**PRO****STHERE**

A Michody Company

## Features Include:

Low voltage cabling is the infrastructure behind all digital systems, including computer networks, access control systems, Wi-Fi access points, data centers, VoIP phone systems, and many others. A smart design plan is crucial for a system to operate correctly. Whether you need to replace or add cabling, we can help. CAT6 cabling is an excellent option for most networks, while fiber optic cabling may be required for backbone cabling, longer cable runs, or just for high bandwidth applications.

Many businesses have a data rack that has out-of-control cable management. This lack of cable management can restrict airflow causing equipment to fail early. It also complicates troubleshooting and equipment replacement. Cable remediation services will get your rack cleaned up and looking its best.

As the demand for network cabling has increased, so have industry standards. Older wiring may not be suitable for applications that require high bandwidth or PoE. Our certified installers can identify existing issues and provide solutions that will meet your needs.

- Access Control Cabling
- Intercom/Paging Cabling
- Wi-Fi Cabling
- Computer Network Cabling
- VoIP Cabling
- Data Center Cabling
- Patch Panel Installation
- Cable Remediation
- Cable Certification

### Did You Know?

Not all cabling is created equally. It is vital to make sure the cabling you use meets or exceeds industry standards.

# PROS THERE

is ready to work with you  
on your cabling needs.

Whether it is new construction  
or an older building,  
we can design a plan and execute it.
